

# Board Ecosystem Risk View

SYNTHETIC EXERCISE DATA - NOT A REAL BANK

## Critical services

Sixteen critical services are connected to explicitly declared Tier 0, owner, external, monitoring, and recovery relationships.

## Current decision frame

Customer harm: review affected-service thresholds. Payment and settlement: preserve obligations without posting untrusted data. Liquidity: maintain independently reconciled position. Integrity and recovery confidence remain unvalidated until evidence supports restoration.

## Concentrations

Enterprise identity, privileged access, payment gateway, telecommunications, backup, DNS, certificates, and third parties require accountable review.

## Evidence

Relationship identifiers connect every board item to a declared dependency, rationale, owner, incident behavior, and recovery behavior. Weak signals do not establish attribution.

## Decisions

Approve recovery identity independence, transaction integrity validation, carrier diversity, and tested substitution without assuming any control is infallible.

## Oversight measures

Track Tier 0 recovery tests, independent investigation, recovery visibility, manual-service capacity, third-party substitution, unreconciled transactions, and overdue corrective actions.
