

Cyber Operational Resilience Decision Intelligence

A decision briefing on shared control planes, trusted transactions and independent recovery

HARBOR RIDGE BANK | FICTIONAL DEMONSTRATION CLIENT

Four choices determine whether disruption becomes customer harm

Identity, transaction integrity, minimum viable payments and independent recovery form the decision frame.

Resilience is a management decision system, not a collection of tools.

Approve authority, evidence thresholds and recovery independence before a timed crisis.

Sixteen critical services share a small set of control planes

The service view connects customer and market need to explicitly declared dependencies.

Enterprise identity is the largest declared common-mode dependency

Counts are critical relationships in the synthetic model, not probabilities or loss estimates.

Identity is the largest modeled common-mode concentration. The count is evidence of dependency, not likelihood or loss.

Tier 0 marks a recovery and decision boundary

Nineteen dependencies have rationale and accountable ownership; designation remains institution-specific.

- Broad authority can create multi-service failure.
- Trusted recovery depends on identity, backup and integrity evidence.
- Human approval remains required after material change.

Ambiguous warning becomes a timed integrity dilemma

Eight phases reveal modeled effects and deadlines without automatic attribution.

Containment decision: preserve payment availability or suspend channels while integrity is uncertain?

Availability can preserve access while increasing financial uncertainty

The containment choice must consider independently reconciled evidence.

KEEP CHANNEL OPEN

Preserves access

May increase unreconciled transactions and customer harm if data cannot be trusted

SUSPEND CHANNEL

Limits questionable posting

Creates immediate service disruption and manual-processing pressure

Decision evidence: journal integrity, independent reconciliation, customer harm and settlement obligations

Production dependencies can follow the bank into recovery

Clean-room restoration is credible only when authority, name resolution, telemetry and evidence are independent.

- Replication can reproduce corruption.
- Backup availability does not prove transaction integrity.
- Failover without monitoring reduces recovery confidence.

Independent recovery removes the most consequential common modes

The target state separates authority, infrastructure visibility and data validation from production.

CURRENT

TARGET

Sequence investment to remove recovery common modes first

Priorities are qualitative and traceable to declared dependency paths.

0-90 DAYS

Approve Tier 0
Freeze unmanaged privilege
Validate clean credentials

NEXT 2 QUARTERS

Independent recovery identity
Immutable evidence
Manual payments test

ONE YEAR

Provider substitution
Carrier diversity
Enterprise reconciliation

Board measures should test outcomes, not tool ownership

Every measure needs an owner, evidence, threshold and trend.

Independent Tier 0 recovery

UNVALIDATED

Owner + evidence + trend

Privilege-disable decision time

MEASURE

Owner + evidence + trend

Unreconciled transactions

MONITOR

Owner + evidence + trend

Third-party substitution

TEST

Owner + evidence + trend

Approve an evidence-led program with accountable owners

Management should return with bounded milestones, validation criteria and residual-risk decisions.

01 Approve recovery-independence priorities

APPROVE

02 Require quarterly evidence against service tolerances

REQUIRE

03 Revalidate Tier 0 after material change
