

Cyber Operational Resilience Decision Intelligence

Run the synthetic nation-state disruption scenario and record accountable decisions

HARBOR RIDGE BANK | FICTIONAL DEMONSTRATION CLIENT

Test decisions under ambiguity without assuming attribution

Participants should protect customers and obligations while evidence remains incomplete.

The exercise tests governance, containment and recovery confidence.

It does not teach intrusion methods or represent a real bank.

Evidence is revealed progressively and decisions are recorded

State assumptions, dissent, residual risk and evidence required for each action.

- Do not invent missing facts.
- Weak signals do not confirm nation-state activity.
- Legal and regulatory timing requires jurisdictional review.
- The facilitator does not automatically propagate undeclared failure.

Decision ownership must remain explicit under time pressure

Incident command coordinates business, technology, risk, legal and communications roles.

- Incident commander: integrates decisions
- Business owners: approve service consequences
- Technical teams: execute bounded actions
- Risk and legal: frame evidence and obligations

Strategic warning evolves into coordinated disruption

The eight-phase control moves from normal operations through stabilization.

Containment decision: preserve payment availability or suspend channels while integrity is uncertain?

Strategic warning should change posture without proving attribution

Review administrative privilege, external signals and decision readiness.

- Reveal government and sector warning.
- Ask whether to raise threat posture.
- Record evidence and dissent.

Ambiguous pre-positioning tests escalation discipline

Correlated but incomplete signals should reach accountable owners.

- Reveal identity and network anomalies.
- Test detecting tools and receiving teams.
- Start the configured decision timer.

Coordinated disruption forces service prioritization

Customer access and payment effects expose shared dependencies.

Integrity uncertainty changes the meaning of availability

Participants must decide whether a functioning channel is safe to operate.

KEEP CHANNEL OPEN

Preserves access

May increase unreconciled transactions
and customer harm if data cannot be
trusted

SUSPEND CHANNEL

Limits questionable posting

Creates immediate service disruption and
manual-processing pressure

Decision evidence: journal integrity, independent reconciliation, customer harm and settlement obligations

Containment trades immediate service for bounded uncertainty

Record authority, deadline, selected action and operational consequence.

01 Isolate identity systems

APPROVE

02 Suspend selected payment channels

REQUIRE

03 Invoke manual processing

REQUIRE

Recovery begins with clean authority and trusted evidence

Failover alone does not establish integrity.

CURRENT

Production identity

Production DNS

Replicated data

Shared monitoring

TARGET

Independent recovery identity

Independent name resolution

Offline integrity evidence

Recovery-visible telemetry

Executives need consequence, confidence and pending decisions

Translate technical evidence into customer, payment, liquidity and recovery impact.

Independent Tier 0 recovery

UNVALIDATED

Owner + evidence + trend

Privilege-disable decision time

MEASURE

Owner + evidence + trend

Unreconciled transactions

MONITOR

Owner + evidence + trend

Third-party substitution

TEST

Owner + evidence + trend

Every gap needs an owner and validation criterion

Capture decisions, evidence gaps, corrective actions and residual risk.

The exercise ends when decisions and evidence are reviewable

Do not convert facilitator observations into unsupported performance claims.

01 Confirm decision log

APPROVE

02 Assign corrective-action owners

REQUIRE

03 Schedule validation and board follow-up
